WaveBook/516E

Ethernet-Based Portable High-Speed Waveform Acquisition

**Features**
- 16-bit/1 MHz A/D
- 1 μs/channel scanning of any combination of channels
- Single and multichannel analog triggering with programmable level & slope
- Digital TTL-level and pattern triggering
- Pulse trigger and external clock
- Programmable pre- and post-trigger sampling rates
- Sixteen digital inputs can be scanned synchronously with analog signals
- Operable from AC line, a 10 to 30 VDC source, such as a car battery, or optional compact rechargeable battery module
- Expandable up to 288 high-speed channels
- SYNC connection allows multiple units to sample synchronously
- Add up to 854 lower-speed thermocouple channels
- DSP-based design provides real-time digital calibration on all channels

**Signal Conditioning Options**
- IEPE dynamic signal inputs
- Strain gages
- Programmable filtering
- Simultaneous sampling
- Quadrature encoder inputs
- Pulse/frequency measurements
- Thermocouples
- High-voltage measurements
- Vehicle bus network

**Software**
- Includes WaveView for Out-of-the-Box setup, acquisition, & real-time display:
  - Scope mode for real-time waveform display
  - Logger mode for continuous streaming to disk
- Comprehensive drivers for DASYLab®, NI LabVIEW®, Visual C++®, Visual C#®, Visual Basic®, and Visual Basic® .NET
- WaveCal software application for easy user calibration
- Supported Operating Systems: Windows 7/Vista/XP SP2, 32-bit or 64-bit

The WaveBook/516E is ideal for measuring dynamic signals in portable and laboratory applications

The WaveBook/516E digitizer offers multi-channel waveform acquisition and analysis for portable or laboratory applications. The WaveBook includes 8 built-in channels expandable up to 72 channels of voltage, accelerometer, microphone, strain gage, thermocouple, position encoder, frequency, high voltage, and other signal types. For applications beyond 72 channels, up to four WaveBooks can be combined within one measurement system, for a total capacity of 288 channels. You can also add up to 854 thermocouples, without consuming measurement bandwidth of the WaveBooks, using the WBK40 Series, and DBK90 signal conditioning options.

WaveBooks are supported with a wide variety of software to address different applications and skill levels. Included WaveView software allows effortless set-up, time-domain waveform viewing, and real-time storage of acquired data to disk*. Also included is PostView, a post-acquisition waveform viewing application, allowing you to visually scroll through multiple waveforms on your PC screen. For users who prefer to program, the WaveBook also includes comprehensive drivers for DASYLab, NI LabVIEW, Visual C++, Visual C#, Visual Basic, and Visual Basic .NET.

Also included is DaqCOM, an ActiveX/COM-based set of development tools that allow users to easily develop their own custom applications in either Visual Basic, or C/C++. DaqCOM allows users to distribute WaveBooks throughout a facility of net-enabled PCs, allowing data acquired on any WaveBook attached on the network to be viewed on other PCs on the network.

DASYLab is also available for the WaveBook, allowing a user to simply connect icons to develop custom test and analysis applications.

---

* WaveView supports up to 72 high-speed input channels. Applications with multiple WaveBooks, or with WBK40/41 thermocouple options, should use DASYLab or other programming applications supported by the WaveBook, including C++, Visual Basic, or NI LabVIEW.
A family of 8-channel WBK expansion options provide volts, accelerometer, strain gage, frequency, and quadrature encoder measurements. Other WBK options provide isolated inputs as well as temperature measurement capability. Most WBK options are fully programmable for gain/range, filter cut-off frequency, AC/DC coupling, etc.

The WaveBook's design is optimized for expansion, reconfiguration and portability. There are no bulky expansion chassis that must be purchased in anticipation of future applications. The compact, all-metal chassis features a low-profile package with front panel inputs.

The WaveBook provides sophisticated multichannel triggering, usually associated with larger, more expensive waveform recorders. The DSP-based design also makes the system more compact than others of similar performance.

The WaveBook operates on a wide range of power sources, such as a standard AC line, an optional rechargeable battery supply, or even a 12V car battery.

All WaveBooks feature an input buffer amplifier on each of its eight channels. This architecture isolates the input signals from any multiplexing transients and greatly improves frequency response. It also provides far less sensitivity to input signal source impedance.

To achieve superior signal fidelity, excellent noise immunity, and greater accuracy, the WaveBook follows the input buffer amplifier with individual differential and programmable gain amplifiers on each channel. In addition, a 5-pole, 20 kHz Butterworth anti-aliasing filter can be software-enabled on a per-channel basis to protect against aliasing of high-frequency signal components. For additional gain and filtering, the WaveBook can be factory configured with a WBK11/HR, WBK12A, or WBK13A.

The WaveBook’s DSP automatically compensates for offset and gain errors in each of its amplifiers, including those found in the WBK expansion options on a per-reading, real-time basis. This compensation is based on calibration constants calculated during the system’s calibration process. The constants are stored in the system’s non-volatile memory. The DSP also permits the WaveBook to accept user-supplied calibration constants, enabling it to automatically scale the input signal for gain and offset individually on every channel.

The WaveBook offers both bipolar and unipolar input ranges, which are per-channel programmable via the sequencer. Bipolar ranges can extend from ±0.05V to ±10V. Unipolar ranges can span from 100 mV to 10V.

The WaveBook also features a 16-bit high-speed TTL digital I/O port for recording discrete TTL-level signals at the beginning of each scan, providing time correlation with the analog inputs.
**Triggering**

The WaveBook offers a variety of trigger modes. Selection of the optimal trigger mode for your particular application requirements saves time and disk space by ensuring that you capture only the data of interest.

A wide selection of programmable analog and digital trigger modes are available for starting an acquisition. All trigger modes, along with the number of scans and the sample rate for pre- and post-trigger data, are software programmable prior to the start of a scan sequence. The WaveBook also supports digital pattern and pulse triggering. Trigger latency (the maximum time from the trigger to the first reading of a scan group) and jitter (the variation of the latency from acquisition to acquisition) depend on the specific trigger source and type of acquisition. Descriptions of each trigger source and the various trigger modes follow.

**Software Trigger.** A software trigger is issued by the PC, and causes the WaveBook to begin scanning the setup predefined in the scan buffer. The trigger latency in this mode is longer than in other trigger modes and is a direct function of the PC’s performance. It is typically 100 μs or less in post-trigger acquisitions.

**Digital TTL Trigger.** The WaveBook accepts a single TTL-level signal input to the DB25 digital I/O connector with rising- or falling-edge trigger sensitivity selected through software. Trigger latency in this mode is less than 300 ns for post-trigger acquisitions.

**Digital Pattern Trigger.** In addition to digital trigger, the WaveBook supports digital pattern triggering. This allows data collection to start when a user-defined 16-bit digital pattern is matched on the digital I/O connector. For example, it is useful when trying to capture noise, vibrations, or some other physical disturbance which occurs at a particular point in a digitally sequenced process, from a PLC or relay logic control system. Trigger latency of the digital pattern trigger is less than 300 ns for post-trigger acquisitions.

**Pulse Trigger.** This high bandwidth input enables the triggering and the collection of lower speed waveforms with the occurrence of a high speed pulse. With Pulse Trigger, the user defines a pulse by an amplitude between ±5V and a pulse width from 300 ns to 0.8 sec.

**Analog Trigger Source.** Analog sources are the most commonly used triggers. The WaveBook supports both single-channel analog triggers for quick captures, as well as multichannel analog triggering.

**Single-Channel Analog Trigger.** Simple single-channel trigger performs analog comparison of channel one to a programmable 12-bit DAC value. You can also select rising- or falling-edge criteria. Trigger latency is less than 500 ns.

When a WBK11/HR, WBK12A, or WBK13A option is installed (providing simultaneous sample and hold or filtering), the trigger input signal is amplified by the simultaneous sample and hold amplifier before being compared against the analog trigger level. This can increase the trigger signal’s sensitivity by a factor of 100.

**Multichannel Analog Trigger.** Multichannel triggering eliminates spurious data by letting you enter a more selective trigger condition to capture events of specific interest. In multichannel mode, any combination of up to 72 analog channels can contribute to the trigger condition. You can individually program each channel to satisfy its trigger criteria using one of eight states from a combination of above/below level, rising/falling edge, and instantaneous/ latched duration. In addition, you can also define a hysteresis band for each channel, reducing false triggers when used with auto re-arm. Finally, you can join all trigger channels together using “ANY” (logical “OR” condition) or “ALL” (logical “AND” condition) Boolean logic operands to form a single, unified trigger condition.

The maximum latency possible in post-trigger acquisitions of the multichannel trigger mode is 2 μs per designated trigger channel, plus 4 μs. For example, if five trigger channels are designated, the maximum latency is 14 μs. The minimum latency in this mode is half the maximum rate; thus, the multichannel trigger jitter time is 1 μs per trigger channel, plus 2 μs.

**Acquisition Modes**

The WaveBook lets you select one of several acquisition modes for collecting your pre- and post-trigger data. The system offers four post-trigger modes and two pre-trigger modes. The WaveBook uses a combination of internal memory, PC RAM, and your PC’s hard disk to seamlessly record all acquired data during the acquisition process.

**Post-Trigger Acquisition**

In post-trigger acquisition, the WaveBook acquires data only after a trigger condition has been met. You have a choice of four post-trigger acquisition modes, each offering benefits suited to particular applications.

**Infinite Linear Mode.** In infinite linear mode, the system acquires data for an infinite amount of time after a trigger occurs. This mode is most useful for chart-recorder replacement applications that require long recordings. Once started, the system keeps digitizing until a “stop” command is issued by your PC. The amount of data you can acquire depends on your PC’s available memory resources.

**Infinite Circular Mode.** In infinite circular mode, the system acquires data into a circular buffer indefinitely until it receives a “stop” command from the PC. When the circular buffer is full, it overwrites previously acquired data; thus the buffer always contains the most recently acquired data. This mode is most useful for
WaveBook/516E
Triggering

applications in which file size is limited by PC resources, or an indeterminate number of scans will occur before the stop condition occurs and only the last scans are required. A typical application is destructive testing in which acquisition is complete when the device fails, and only the final failure mode characteristics need to be captured.

**Finite Linear Mode.** When operating in finite linear mode, the system acquires data after receipt of the trigger until a specified number of scans (from 1 to 100 million) are acquired. Finite linear mode is suitable for applications in which the duration of the event is known.

**Re-arm.** Finite linear mode permits the specification of the “re-arm” condition. Under such a condition, after a specified number of scans is acquired, the system automatically prepares for a new acquisition by re-arming and re-enabling the trigger, and then capturing a new finite number of scans without the need for either user or computer intervention. This capability is useful in emulating a DSO (Digital Storage Oscilloscope), which typically offers continuous retrace. It is also beneficial for unattended captures in which critical trigger events occur at indeterminate intervals, making manual re-arms awkward. It is further useful for applications in which trigger events occur so quickly that it is difficult to respond manually or under software control.

**Finite Circular Mode.** In this mode, the WaveBook acquires data into a circular buffer until a specified number of scans (from 1 to 100 million) is acquired. When the circular buffer becomes full, it writes over previously acquired data, and thus always contains the most recently acquired data. This mode is useful for trigger delays; for example, the unit can be pre-configured to record 100,000 scans (after the trigger) at 10 μs intervals and to save only the last 10,000 of the 100,000. In this example, the final record would contain only data acquired 900 ms after the trigger.

---

**Channel-Scanning Flexibility**

The WaveBook provides maximum scanning flexibility via a programmable channel/range sequencer. You can load the sequencer with any combination of channels and associated ranges. Once loaded, the sequencer waits for the trigger condition to be satisfied, after which it begins scanning and digitizing. When scanning begins, the WaveBook selects the appropriate channel and gain, digitizes the input signal, calibrates the reading, and transmits it to the PC via the on-board, 65 Kword FIFO buffer (or into optional internal memory, up to 128 Mbytes). This process is repeated at a 1 μs/sample rate until all channels within a scan group are completed.

Upon completion of a scan group, the WaveBook can be configured to proceed in one of several fashions. For example, the system can be programmed to begin the next scan after a period of 1 μs to 100s, programmable in 0.05 μs increments. It can also be programmed to wait indefinitely until the trigger condition is next satisfied, after which it will again perform a specified number of scans, from 1 to 100 million.

The WaveBook also supports pre-triggering, and is capable of acquiring up to 100 million scans prior to satisfaction of the trigger condition. The pre-trigger buffer is circular, and thus always provides the most recently acquired readings prior to the occurrence of the trigger. In addition, the system permits pre-trigger scan group repetition at one rate and post-trigger scan group repetition at another rate. For example, the system can be configured to repeat scans 1,000 times per second prior to the trigger, and then 100,000 times per second after receipt of the trigger.

WaveBook Scanning Example

Scan group

All channels within a scan group are measured at a fixed 1 μs/channel

Digital input lines, tach inputs, and encoders can also be sampled before the analog inputs in a sequence

1 μs

Channel

Gain

Unipolar or bipolar

Unipolar or bipolar operation can be programmed for each channel dynamically

Gain can be programmed for each channel dynamically

Channels can be sampled arbitrarily

Expansion channels are sampled at the same rate as internal channels

---

Finite Linear Mode permits the specification of the “re-arm” condition. Under such a condition, after a specified number of scans is acquired, the system automatically prepares for a new acquisition by re-arcing and re-enabling the trigger, and then capturing a new finite number of scans without the need for either user or computer intervention. This capability is useful in emulating a DSO (Digital Storage Oscilloscope), which typically offers continuous retrace. It is also beneficial for unattended captures in which critical trigger events occur at indeterminate intervals, making manual re-arms awkward. It is further useful for applications in which trigger events occur so quickly that it is difficult to respond manually or under software control.

**Finite Circular Mode.** In this mode, the WaveBook acquires data into a circular buffer until a specified number of scans (from 1 to 100 million) is acquired. When the circular buffer becomes full, it writes over previously acquired data, and thus always contains the most recently acquired data. This mode is useful for trigger delays; for example, the unit can be pre-configured to record 100,000 scans (after the trigger) at 10 μs intervals and to save only the last 10,000 of the 100,000. In this example, the final record would contain only data acquired 900 ms after the trigger.
WaveBook/516E
Triggering

Pre-Trigger Acquisition
Pre-trigger permits the acquisition of readings prior to the receipt of a trigger condition. Pre-trigger can be used with any of the four trigger modes described above.

When pre-trigger is selected, the rate at which a scan group repeats can differ before and after a trigger*. (Please note while the sample rates between pre- and post-trigger scan groups can differ, the time between consecutive samples within a group is fixed at 1 µs.) For example, a scan group of 8 channels can be repeated at 1000 scans per second prior to a trigger condition, and at 100,000 scans per second after the trigger. The number of scans acquired during both time periods is also programmable.

The WaveBook first acquires a specified number of pre-trigger scans at the pre-trigger scan rate, and then arms the trigger, guaranteeing that at least the specified number of scans have been acquired before the trigger. The system continues to collect scans at the pre-trigger scan rate until the trigger occurs. Once the trigger is detected, the system finishes collecting the current pre-trigger scan, switches to the post-trigger scan rate, acquires readings using one of the four post-trigger modes described above, and then stops the acquisition. The number of pre-trigger and post-trigger scans are each independently programmable from 1 to 100 million.

Pre-Trigger Circular Mode (requires WBK30 installed). In this mode, data is placed into a circular buffer until the buffer fills, after which the buffer writes over previously acquired data. The system stays in this mode, waiting for the pre-set trigger condition to be met, until the condition occurs or the acquisition is halted by the PC. Upon detection of the trigger condition, the system begins the post-acquisition readings. Since, for practical applications, the WaveBook is only limited by the PC’s resources, extremely deep circular buffers can be configured for both the pre- and post-trigger data.

Pre-Trigger Linear Mode**. In this mode, the WaveBook continues collecting data without writing over old data. Since the amount of pre-trigger data can be nearly infinite (if the trigger takes a very long time to occur), this mode may require extensive PC resources to avoid data loss. Unlike the pre-trigger circular mode, which delays the trigger arm condition until a predefined number of scans is collected, the pre-trigger linear mode permits the WaveBook to begin recording post-trigger data as soon as the trigger condition is met, regardless of the number of pre-trigger scans collected. This mode is useful for applications in which the desired number of pre-trigger scans is indeterminate prior to the start of acquisition and all data must be acquired.

External Clock Input***
The WaveBook supports an external clock input, allowing the scanning of data to be dependent upon an external pulse train. This feature is useful in rotating machine or motion applications where data collection is dependent upon rotational speed or axial position. In addition to allowing one scan per pulse, the WaveBook’s external clock input features a programmable divider capable of reducing the incoming clock by up to 255. This is useful when the external clock source is faster than the optimum sample rate for the data collection task.

* PostView software does not support pre-trigger scan rates that differ from post
** Pre-trigger linear mode and auto re-arm in the WaveBook hardware are not supported in WaveView
*** Full 1M rate not available with external clock
†† External clock counter and the high-speed digital inputs are mutually exclusive; adding the external clock counter to the scan list is equivalent to adding two analog channels
†‡ Requires two locations in the scan sequencer
††† The maximum scan rate when using SS&H is \( \frac{1 \text{ MHz}}{(n + 1)} \) where \( n \) is the number of channels in the scan list

Multi-Unit Synchronization
Multiple WaveBook/516Es and WBK40/41s can be synchronized via the rear-panel SYNC ports. Simply connect 2, 3, or 4 WaveBooks together using SYNC cables (CA-74-1). WaveBook software establishes one of the WaveBooks as the master and the others as slaves. Master WaveBooks can run at the full 1 MHz aggregate sampling rate; slave WaveBooks must have 0.1 µs of unassigned sampling time in the scan group (some trigger modes are not supported in multi-WaveBook systems).

Simultaneous Sampling†††
The WaveBook samples each channel in sequence, at a fixed 1 µs/channel rate. For example, when eight channels are scanned sequentially, the time between sampling the first channel and the eighth channel is 7 µs. For applications that require simultaneous sampling (within 100 ns) of all channels, the optional WBK11/HR eight-channel simultaneous sample and hold card and the WBK13A programmable low-pass filter card with simultaneous sample and hold are available. The WBK11/HR or WBK13A can be installed in the WaveBook, or the WBK10A expansion chassis; they provide simultaneous sampling of all channels in a module. Even when multiple WBK11/HR or WBK13A cards are used within one system, all channels with simultaneous sample and hold active are sampled within 100 ns of one another. Some WBK options include built-in simultaneous sampling, including the WBK16/SSH and WBK18.
The WaveBook and its associated WBK modules offer the flexibility to be powered either directly from a 10V to 30V DC source or via the included TR-40U AC power adapter. Options such as the WBK11/HR, WBK12A, and WBK13A signal conditioning cards install directly into the WaveBook or WBK10A and derive their power from those units.

Table 1

</table>

If you are operating each module with its included TR-40U AC power adapters, then no calculations are required; just connect the power adapters. In certain applications, however, it may be advantageous or more convenient to operate all components from a single source such as a battery or UPS such as the DBK34A. In those cases, the following worktables provide the necessary information for calculating current requirements for your particular system.

Calculating the Current

Table 2 provides the approximate required amperage for each component in your system when using a 15V supply. Using this table, calculate the maximum amount of amperage your system will draw by multiplying the quantity of components used by the amperage. Total the values in the last column to arrive at the maximum amperage; then verify that your power source has enough current capacity (see Table 1).

* Typically draws power from diagnostic connector
WaveBook/516E

General Information

External Power Modules

DBK30A
For small, portable applications, the optional DBK30A rechargeable battery module provides up to 3.5 hours of operation at 2.0A current draw. The DBK30A, which is housed in a rugged metal enclosure of the same footprint as the WaveBook, and can be mounted under the system by using the built-in mounting brackets. The DBK30A includes an AC charging supply.

The DBK30A rechargeable battery/excitation module

DBK34A
The DBK34A provides back-up power as an uninterruptible power supply (UPS) to the WaveBook. If DC power is interrupted during an acquisition, this module provides temporary power so the measurement is not disturbed. The DBK34A is powered from an external DC power supply; it does not include an AC charger.

Ethernet Features

The WaveBook/516E includes a 10/100BaseT Ethernet interface

The WaveBook/516E transfers acquired data to the PC via 10/100BaseT Ethernet, allowing a continuous stream of a virtually unlimited amount of data to be collected and stored in a PC’s memory or hard drive.

The WaveBook/516E can be expanded up to 72 channels using 8-channel WBK expansion options. The WaveBook/516E also has 3 built-in parallel expansion ports, permitting connection of up to three additional WBK40 Series units. A sync signal between all devices insures that multi-device systems acquire data synchronously. In total, up to 288 channels of high-speed input can be measured via one Ethernet link*. Also, additional channels are possible using an Ethernet expansion hub, allowing multiple WaveBook/516E units to be attached to one PC.

The WBK40 Series of options connect to one of the WaveBook/516E’s parallel expansion ports. Since the WBK40 has its own 200 kHz A/D converter, it does not consume bandwidth from the WaveBook’s 1 MHz A/D. The SYNC connection insures that both A/Ds measure synchronously.

There are two advantages of seamlessly supporting multiple WaveBooks in one system. First is the ability to expand beyond the 72 channel capacity of a single WaveBook. Second, if the per-channel sampling rate of a single WaveBook system is inadequate, then additional WaveBooks can provide more bandwidth per channel.

* The maximum continuous data transfer rate from a multiple WaveBook system to the PC on a dedicated Ethernet link is 2 Mreadings/s
WaveBook/516E
General Information

The most common and highest-performance WaveBook/516E connection is with dedicated, point-to-point Ethernet link between the PC and the WaveBook/516E. Data transfer rates in this configuration will accommodate continuous, 1 Mreading/s transfers from the WaveBook/516E to the PC. This connection method is not recommended when continuous, 1 Mreading/s transfers from the WaveBook/516E are required. To improve the data transfer performance of WaveBook/516E’s in this configuration, the WBK30 memory options may be installed into the WaveBook.

With an enterprise-wide Ethernet network connection, any number of WaveBook/516E’s can be connected to the network, which is shared amongst a potentially large number of Ethernet-connected devices. In this mode, the data transfer rates from the WaveBook/516E will be dependent on other network traffic at the time of data transfer.

The parallel expansion ports on a WaveBook/516E can also be used to attach a fourteen-channel WBK40 thermocouple interface module. The WBK40 has an internal A/D converter, so that it does not consume valuable bandwidth from the WaveBook/516E’s 1 MHz A/D converter. The SYNC signal on the WaveBook attaches to the SYNC input on the WBK40, insuring that both A/D’s are operating synchronously to one another. The WBK40 can be expanded up to 244 thermocouple channels using DBK84 14-channel TC interface modules.

In synchronous master/slave systems or when using a WBK40/41 module, it is possible to run the slave units at a slower clock rate than that of the master device in the system. This configuration may be necessary when it is desirable to have a system which has signals that need to be sampled at widely varying rates while remaining time synchronous to the master unit.

**Note:** The WBK40 and WBK41 are not currently supported in WaveView. We recommend using DASYLab® when using these modules, which includes full support for the WBK40/41. The WBK40/41 are also supported in NI LabVIEW®, and DaqCOM. If it is necessary to use these modules in conjunction with a WaveView application, then it is necessary to launch a second, concurrent application to acquire data from the WBK40/41 into separate data files.
Module-to-Module Connection for WaveBook Systems

Assembling a WaveBook system is easy with our new packaging and module-to-module connection system. Every WaveBook and WBK option is housed in an all-metal enclosure, and is encased with rugged molded bumpers on all corners. The bumpers serve to protect the connectors as well as to attach multiple modules together. Within each bumper is a tab which can be rotated 90° to lock with other modules attached to either the top or bottom of each module.

One handle is included with each WaveBook, and additional handles can be purchased for in-vehicle applications where a handle on both sides of the system is desirable for securing the system to the vehicle. When multiple modules are attached in a system, the handle can be easily moved from the WaveBook to any other module in the system.

For owners of existing WaveBook and/or WBK systems, the new bumpers can be easily added to your existing hardware. Contact IOtech or your local IOtech representative for details.

Built-in connection tabs in every expansion module make assembling a system easy – above illustrates how a WBK18 would attach to a WaveBook/516E.

An assembled system consisting of a WaveBook/516E plus one WBK18 accelerometer module plus one WBK16 strain gage module.
WaveView

WaveView

WaveView* is a Windows-based setup and acquisition application that allows you to configure, display, and save data to disk within minutes of taking the WaveBook Out-of-the-Box. WaveView provides a point-and-click interface that simplifies operation of the WaveBook by allowing setup of all hardware, including the field-installable WBK options, without programming or connecting icons.

Unlike the mere example programs that many suppliers provide with data acquisition hardware, WaveView is a full-featured acquisition and display engine that provides all the functionality needed for many data-logging and display applications. For more frequency-domain analysis applications, use DASYLab®.

WaveView’s intuitive approach to hardware control simplifies system setup by automatically querying the WaveBook upon connection to your PC. As WBK options are added for signal conditioning or increased system channel count, WaveView’s channel configuration spreadsheet automatically expands to accommodate the additional channels. Specific channel characteristics, such as gain, unipolar/bipolar, and channel labels, are automatically updated, and any additional functionality (such as low-pass filtering, filter cutoff, or excitation output), also automatically appear in the channel-configuration spreadsheet. WaveView is also designed for easy operation with display and analysis packages. WaveView provides data in formats compatible with a variety of sophisticated display and analysis packages.

Note: The WBK40 and WBK41 are not currently supported in WaveView. We recommend using DASYLab® when using these modules, which includes full support for the WBK40/41. The WBK40/41 are also supported in NI LabVIEW® and DaqCOM. If it is necessary to use these modules in conjunction with a WaveView application, then it is necessary to launch a second, concurrent application to acquire data from the WBK40/41 into separate data files.

* Supported Operating Systems: Windows 7/Vista/XP SP2, 32-bit or 64-bit

Included WaveView is an Out-of-the-Box setup, acquisition, and real-time display program

1. Designate an individual data channel as active or inactive by clicking on a select channel.
2. Reading column provides quick indication of sensor condition before acquisition begins.
3. Choose different ranges or gains for each channel, based on the particular WBK options installed. Bipolar and unipolar scales can also be selected for each channel.
4. Assign each channel a unique label, which will be automatically referenced throughout WaveView. Choose the desired engineering units in which to display acquired data, based on the installed WBK options. Parameters can also be entered to perform mX+b scaling on each reading before displaying it.
5. Use auto-zero to remove small offsets such as transducer drift or pre-load conditions prior to acquisition.
6. Enhanced features such as filter type, cutoff frequency, IEPE current source, and bridge configuration automatically appear when hardware is added to the WaveBook system. There are no switches to set and WaveView automatically updates itself for new configurations.
7. Click to review system configuration and acquisition parameters such as scan rate, pre- and post-trigger usage, and trigger criteria.
8. Scope Mode allows customizing and displaying of multiple traces; it supports cursors, re-scaling, and more.
9. Store data to disk in real-time; the auto re-arm function, with automatic file naming, supports back-to-back acquisition of over one million captures without user intervention.
10. Review acquired waveforms with a strip chart style display via PostView.
11. Strain gage setup to calibrate WBK16 strain gage channels.
WaveView

Out-of-the-Box Software

Scan and Trigger Configuration. The WaveBooks’ powerful event-capture capability is made available through the simple, fill-in-the-blank style boxes in WaveView. In addition to single-channel, manual, and external TTL, advanced triggering for multichannel, digital pattern, and pulse trigger is also available. When using multichannel trigger all channels can be combined with boolean “AND” & “OR” operators to begin the acquisition at just the right time. In digital pattern mode, the WaveBook triggers on a user-defined bit pattern making it easy to associate analog data with digital sequences.

Unique to the WaveBook is the pulse trigger capability shown below. Typically available in systems many times its price, pulse trigger allows capturing that elusive event by defining the level of the signal and pulse width criteria. Now “runt” pulses or glitches buried in apparently good signals can be easily captured.

Scope Mode. Unlike a traditional scope with only two to four channels, WaveView’s Scope Mode allows any eight channels to be displayed. Furthermore, WaveView is not handicapped by the small memory limitations of DSOs. In fact, WaveView dynamically and transparently allocates a PC’s RAM prior to beginning an acquisition. A simple point-and-click is all that’s necessary to initiate multi-Msample acquisitions. In addition, because the data is already in the PC’s RAM, a second point-and-click on the disk icon automatically saves this data to disk for import into PostView, a post-acquisition waveform review package, or into analysis packages, such as DADiSP® or Excel®.

You can configure the WaveBook via WaveView’s scan and trigger configuration screen

1. Allows selection of internal or external clock.
2. Lets you individually set acquisition duration for both pre- and post-trigger data.
3. Offers separate scan rates for both pre- and post-trigger data.
4. Select the trigger mode you need: immediate, manual, multichannel, digital pattern, or pulse.

Scope Mode allows you to display any eight of the WaveBooks’ channels

1. Supports continuous or single-shot capture and display modes.
2. Provides zoom-in and zoom-out window control of the x-axis.
3. Displays user label and cursor data values.
4. Scroll through all data.
5. Provides auto-scale for quick maximization of the y-axis display.
6. Automatically scales axis in user-defined engineering units.
7. Enables cursor for on-screen measurements.
Logger Mode. For applications where PC RAM is insufficient to record the entire test or where rapid back-to-back recordings need to be saved to disk, WaveView provides a Logger Mode. It complements WaveView's Scope Mode by allowing continuous* recording data directly to disk.

Logger Mode can auto-increment file names to provide the unattended capture of millions of back-to-back events, without user intervention. Acquired data can be stored in several data formats for direct import to packages such as Excel® or PostView.

WaveView's Logger Mode can stream data direct to disk in a variety of formats

1. Allows the collection of single-shot or auto-increment file names for back-to-back acquisitions.
2. File name, path, and auto-increment index can be entered by simply filling in the blank.
3. Auto increment creates multiple data files, one per trigger.
4. Choose from an ever-growing list of data file formats for easy importing into other software packages such as DASILab, DASYLab, Snap-Master, ASCII/Excel Universal File Format (UFF) 58A (ASCII), Universal File Format (UFF) 58B (Binary), and .WAV.

PostView
PostView is a time-domain post-acquisition data viewing package which is integrated and ready to use from within your View package when you install it. PostView provides easy to use basic time-domain data viewing for IOtech data acquisition Out-of-the-Box View packages.

WaveCal
The WaveBook is also shipped with WaveCal, an application that facilitates periodic calibration of the system. Although all WaveBook components are factory-calibrated to their rated accuracies prior to shipment, annual recalibration is recommended. WaveCal's simple on-screen instructions and direct access to the WaveBook's components, make recalibration fast and easy.

* For acquisitions in excess of 100 million scans, use DASYLab® or other available software.
WaveBook/516E
Specifications & Ordering Information

General Specifications
Warm-up: 30 minutes to rated specifications
Environment
- Operating: 0 to 50 °C, 0 to 95% RH, non-condensing
- Storage: -20 to 70 °C
Power Consumption: 1.8A max @ 15 VDC
Input Power Range: 10 to 30 VDC
Vibration: MIL STD 810E
PC Communication: 10/100BaseT Ethernet (300 ft, max)

Analog Inputs (18 to 28 °C)*
Channels: 8 differential, expandable up to 72 differential
Connector: BNC
Resolution: 16 bit
Ranges:
- Unipolar: 0 to +10V, 0 to +4V, 0 to -2V
- Bipolar: ±10, ±5V, ±2V, ±1V
- Maximum Overvoltage: ±35 VDC
Input Bandwidth: DC to 500 kHz
Input Impedance:
- Single-Ended: 5M Ohm in parallel with 30 pF
- Differential: 10M Ohm in parallel with 30 pF
Accuracy:
- ±2 to ±10V: ±0.012% of reading, 0.006% of range
- ±1V: ±0.018% of reading, 0.008% of range
Input Noise: <2 LSB (RMS)
Total Harmonic Distortion: -84 db typ
Signal to Noise and Distortion: +74 db typ
CMRR: 80 dB typ; 70 db min; DC to 20 kHz

Anti-Alias Filter**
Type: 5-pole Butterworth; 20 kHz, low-pass software enabled

Triggering
Channel 1 Analog & Pulse Trigger
Input Signal Range: -10 to +10V
Bandwidth: 1 MHz
Latency: 300 ns
Multi-Channel Analog Trigger (up to 72 channels)
- Range: Selectable per channel to input range
- Latency: 2 μs/channel, plus 4 μs max
TTL Trigger
Input Signal Range: 0 to 5V
Input Characteristics: TTL-compatible with 10k Ohm pull-up resistor
Latency: 300 ns
Software Trigger
Latency: 100 μs typical
Pulse Trigger Input
Input Signal Range: ±5V
Input Characteristics: 75 Ohm
Input Protection: ±10V max
Minimum Pulse Width: 100 ns
Maximum Pulse Width: 0.8 sec
Latency: 300 ns

External Clock
Connector: Available on DB25 digital input
Input Signal Range: 5V TTL compatible
Input Characteristics: 50k Ohms pull up (to +5V) in parallel with 50 pF
Input Protection: Zener clamped -0.7 to +5V
Divisor Ratio: Divide by 1 through 255, selectable
Clock Counter Accuracy: <0.02% error
Clock Counter Range: 0.01 Hz to 100 kHz

Sequencer
Operation: Programmable for channel, gain, and for unipolar/bipolar range in random order
Depth: 128 location
Channel-to-Channel Rate: 1 μs to 1.1 μs/channel, all channels equal
Maximum Repeat Rate: 1 MHz
Minimum Repeat Rate: 100 seconds per scan
Expansion Channel Sample Rate: Same as on-board channels, 1 to 1.1 μs, fixed

High-Speed Digital
Inputs/General-Purpose Outputs
Connector: DB25 Female
Configuration: 16 TTL-compatible pins, selectable for input or output
Input Characteristics: TTL-compatible
Output Characteristics: ALS TTL output in series with 33 Ohms
Output Updates: Outputs may be changed via program control
Input/Output Protection: Diode clamped to ground and +5V

Ordering Information
Description
- 16-bit Ethernet, 1 MHz portable data acquisition system includes WaveView, and PostView; comprehensive drivers for DASYLab®, NI LabVIEW®, Visual C++®, Visual C#®, and Visual Basic® .NET; WaveCal software application; and AC adapter
- WaveBook/516E

Accessories
- Tough, rugged, and lightweight carrying case
- Rack mount kit for WaveBook/516E
- RackDBK4

Cables
- Ethernet patch cable, 1.5 ft. CA-242
- Ethernet patch cable, 7 ft. CA-242-7
- DB25 male to DB25 female, parallel cable, 2 ft. CA-35-2
- SYNC cable, 1 ft. CA-74-1
- 5-pin male DIN to 5-pin male DIN, lighted power cable, 8 ft. CA-115
- DB25 to external clock, 100 ft. CA-178

CE Compliant Cables
- 1 male BNC to male BNC, 15 ft. CA-150-1
- 8 male BNC to male BNC, 15 ft. CA-150-8

Software
- Icon-based data acquisition, graphics, control, and analysis software with WaveBook driver
- DASYLab

* The following applies when outside 18 to 28 °C and is additive to the above specification:
- Range ±10V: 24 ppm/°C, 60 μV/°C
- ±5V or 0 to 10V: 24 ppm/°C, 30 μV/°C
- ±2V or 0 to 4V: 24 ppm/°C, 12 μV/°C
- ±1V or 0 to 2V: 36 ppm/°C, 8 μV/°C
** No unipolar mode or anti-alias filter with WBK11/HR, WBK12A, or WBK13A installed
