USB-2408 Series
24-Bit Multifunction Temperature & Voltage Devices

Overview
The USB-2408 Series are multifunction DAQ devices designed for highly-accurate voltage or temperature measurements. Each device features provides up to 16 single-ended (SE)/8 differential (DIFF) analog inputs, 8 digital I/O, and two counter inputs. The USB-2408-2AO also features two analog outputs. Each device in the series offers 24-bit resolution for ultra-accurate voltage or thermocouple measurements.

Analog Input
Each device includes 16 SE/8 DIFF analog inputs which you can configure for voltage or TC input on a per-channel basis. Eight software-selectable voltage input ranges are provided. You can configure these ranges on a per-channel basis from ±10 V to ±0.078 V.

When measuring TCs, configure analog inputs in DIFF mode. All devices also include open TC detection to identify improperly working thermocouples.

Sample Rate
USB-2408 Series devices can sample analog input channels at up to a 1 kS/s. Refer to the USB-2408 or USB-2408-2AO user’s guide to learn how noise filtering affects the throughput rate for analog inputs.

Analog Output (USB-2408-2AO only)
The USB-2408-2AO includes two 16-bit analog outputs. Each output has a ±10 V range. Both outputs can be updated at a rate of up to 500 S/s per channel; one output can be updated at a rate of 1 kS/s.

Sample Rate
USB-2408 Series devices offer high-resolution voltage or thermocouple measurements along with digital I/O and counter inputs. The USB-2408-2AO (shown here) includes analog output functionality.

Features
- Measure thermocouples (TCs) or voltage
- Up to 16 analog inputs
- 24-bit resolution
- Up to 1 kS/s sampling

Supported Operating Systems
- Windows® 10/8/7/Vista® XP, 32/64-bit

Digital I/O
Eight digital I/O channels are included with each USB-2408 Series device, and you can read from or write to each individual bit.

Counter Input
Two 32-bit event counters are provided to count TTL pulses at read/write rates of up to 500 Hz. The counters accept inputs of up to 1 MHz.

Calibration
The USB-2408 Series is factory-calibrated using a NIST-traceable calibration process. Specifications are guaranteed for one year. The USB-2408 Series also supports field calibration for users to calibrate the device locally with the InstaCal utility.

Includes CJC measurement error and polynomial linearization error; valid for one year or 3000 operating hours. Each terminal block has a CJC sensor. The accuracy listed above assumes the screw terminals are at the same temperature as the CJC sensor. Connect thermocouples so that they float with respect to AGND.

Refer to the USB-2408 or USB-2408-2AO user’s guide for the following specifications:
- Noise performance
- Channel switching error

Throughput rate: The maximum throughput is 1.1 kS/s aggregate. The USB-2408 can set conversion rates on a per-channel basis. Refer to the hardware user’s guide for tables and formulas for single- and multichannel throughputs.

### Analog Voltage Output (USB-2408-2AO only)

Leave unused AOUTx output channels disconnected. The USB-2408-2AO output voltage level defaults to 0 V whenever the host PC is reset, shut down or suspended, or if a reset command is issued to the device.

The duration of the output transient depends on the enumeration process of the host computer. The output of the USB-2408-2AO is typically stable after two seconds.
